LEARNING IN THIS CHAPTER
- Program and Programming Concepts
- Machine Language
- Assembly Language
- High-Level Language
- Fourth Generation Language

Language is a medium to express our views and feelings. To communicate with a computer, we need a language that a computer understands. For every action, a computer has to be given instructions accordingly.

- A Program is a set of instructions that tells the computer what to do.
- The process of writing specific instructions in a computer language is called Programming. Each programming language has its own specific rules. The development of programming languages has improved considerably, with the ease and ability of programmers to write powerful application programs.

The development of computer languages has been classified into the following categories:

**MACHINE LANGUAGE (FIRST GENERATION)**

It is the only language that a computer understands. It is expressed in binary form, i.e., '0' and '1' where 0 means 'Off' state and 1 means 'On' state.

Machine Language has the advantage of very high speed and very low memory utilisation.

But understanding and learning machine language is a tough and time consuming process. It is very difficult to write and debug programs written in machine language. It is extremely machine-dependent. That is why Machine language is also regarded as Low Level Language (LLL). A machine language program written on one computer may or may not run on another computer. Because of this, very few people opt for specialization in machine language.

**ASSEMBLY LANGUAGE (SECOND GENERATION)**

This language uses Mnemonic codes or Symbols in place of 0 and 1. For example, if the operation code for add is 0010 in binary language, it can be directly written as 'ADD' in assembly language, as Assembly language uses symbolic codes. Hence, it is easy to work with Assembly language than in binary language.

Since a computer can understand only machine language, so assembly language programs have to be converted into machine language. Translator programs known as Assemblers were developed to convert the assembly
language program into machine language. A program written in assembly language is called the **Source program**, whereas, the program converted into machine language by the assembler is called **Object program** or **Object code**. Like machine language, assembly language is also machine-dependent and programming in this language is quite time-consuming. Thus, it is also regarded as a Low Level Language (LLL).

**HIGH-LEVEL LANGUAGE (THIRD GENERATION)**

The restrictions in the usage of machine and assembly languages prompted people to develop a language with the following features:

- Simple and user-friendly language
- Language that is machine-independent

Owing to the above mentioned features, it became easy to learn and use the computer languages. A large number of people started writing computer programs using these languages. It is also known as **High-Level Language** (HLL). High-level language is quite similar to the English language. Basic, C, C++, Java, etc., are some of the very popular examples of high-level languages.

High-level language programs need to be translated into machine language by using the **Translator programs**. There are two types of translator programs which are as follows:

**INTERPRETER**

This translator program is used to convert a high-level language program into machine language. An Interpreter translates line by line, executes the instruction and then repeats the procedure for the remaining instructions. If any errors are found, they are to be removed immediately. As the converted form is not stored anywhere, so it has to be generated at the time of execution of a program. Interpreter programs are preferred for beginners and are slow in execution speed.

Suppose, the French President is visiting India on an official tour. In order to understand each other, both the French President and the Indian Prime Minister would require an **interpreter** to translate the French language into the English language and vice versa.
COMPILER
Compiler is a translator program, used to convert a high-level language program into machine language. A Compiler translates the whole program at once, i.e., it generates the object code for the program along with the list of errors. The execution speed of a compiler is faster as compared to an interpreter.

FOURTH GENERATION LANGUAGE (4GL)
Fourth generation languages are closer to human language than any other high level languages.

Fourth generation languages are combination of languages with the following features:

1. Highly user-friendly and independent of any operating system.
2. Very high speed of execution. Designed to reduce the level of programming efforts.
3. Minimum efforts from the user to obtain any information.
4. Designed to reduce the overall time it takes to develop software and the cost of software development. In 4GL, the user has to specify only the required output they want, while the computer determines the sequence of instructions that will accomplish those results.

Let's Know More

FORTRAN was one of the earliest languages and was designed for scientists and engineers.
COBOL was designed for business users.

Know the Fact
Spacewar was the first interactive computer game.

Let's Know More
In software development, beta release refers to a product or a technology, which is still in development, but is release only for testing and evaluation purpose.

Recap
Programming is the process of writing specific instructions in a computer language.
Machine language is the only language that a computer understands.
Syntax are the rules governing the formation of statements in a programming language.
An Interpreter translates line by line, whereas a Compiler translates the whole program at once.
The term software was first used by John W. Tukey in 1957.
A. Fill in the blanks:

1. A ____________________ is a set of instructions, which tells the computer what to do.
2. The development of computer languages can be classified into ____________________ categories.
3. ____________________ language consists of binary numbers, i.e., 0 and 1.
4. ____________________ convert the assembly language program into machine language.
5. ____________________ language uses simple English words and Mathematical operators.
6. ____________________ language uses mnemonic codes or symbols.
7. ____________________ are the rules governing the formation of statements in a programming language.
8. In binary language, 0 means ____________________ and 1 means ____________________ state.

B. State True or False:

1. Machine language is the only language, which a computer understands.
2. Assembly language is regarded as the first generation language.
3. Each programming language has its own specific rules.
4. Compiler converts a high level language program into machine language, line by line.
5. High-level language program has to be converted into machine language by translator programs.
6. Fortran language was designed for business users.
7. Programming is the process of writing specific instructions in a computer language.

C. Application Based Questions:

1. Kapil's aunt was a computer programmer during the third generation of computer language. Which kind of language did she use then?

2. Sumit is trying his hand at Java programming, but he does not know which type of language it is. Help him to solve his query.
A. Multiple Choice Questions:

1. A program written in the assembly language is called ........................................
   a. Assembler  b. Source Program  c. Object Program

2. An ................................ converts a high-level language program into machine language, line by line.
   a. Assembler  b. Compiler  c. Interpreter

3. The program converted into machine language by the translator is called ........................................
   a. Source Program  b. Object Program  c. Assembler

4. The term software was first used by ........................................

B. Answer the following:

1. What do you mean by Machine language?

2. How is Assembly language different from Machine language?

3. What are the features of a high-level language?

4. Differentiate between an interpreter and a compiler.

5. List any three characteristics of the Fourth generation language.
CHARACTER

Character is the sum total of a person’s values, beliefs, and personality. It is reflected in our behaviour and actions. It needs to be preserved more than the richest jewel in the world. To be a winner, you need to develop the right character.

Character is a combination of integrity, unselfishness, understanding, courage, loyalty, and respect.

- Apply Heading 1 style to the Title - CHARACTER. Set the font colour to red.
- Select the paragraphs and apply border to them. Make change in the line style, colour, and width.
- Set the text font size to 14. Apply WordArt style on the first word ‘Character’. Insert an online picture and save the file. Observe the effects.

GROUP DISCUSSION  For Concept Clarity

Conduct a group discussion on the topic: Development of Computer Languages.

PROJECT WORK  Using Creativity

The term Artificial Intelligence (AI) has become a buzzword in the field of computer science. Search more about AI with the help of Internet, newspaper, and computer magazines. Make a PowerPoint presentation on the topic: Development of Artificial Intelligence.
